

CMMC Enclave Build

A Tailored Approach to CMMC

At Coalfire®, our CMMC Enclave Build delivers a seamless, customized path to certification; combining our deep advisory and engineering expertise to guide you through every step of the process. From initial assessment to secure environment buildout, we help you evaluate your current state and develop a compliant enclave for managing Controlled Unclassified Information (CUI).

The Challenge

Obtaining a CMMC certification requires significant resources, planning, and expertise. Many in the Defense Industrial Base (DIB) face hurdles in understanding requirements, estimating costs and timelines, and preparing their environments for CUI handling.

Our Approach

Drawing from our extensive FedRAMP experience—which closely aligns with CMMC domains and practices—Coalfire's CMMC Enclave Build approach begins with understanding your objectives, IT ecosystem, and CUI storage and lifecycle.

We then design and deploy a secure enclave using infrastructure-as-code, implementing the necessary security tools and storage solutions to protect your CUI. Throughout the journey, we develop your CMMC documentation and provide support across the assessment process, ensuring you're well-positioned for certification success.

Why Coalfire

- **An Experienced Partner:** Our team has designed and built dozens of highly regulated environments.
- **Tailored to You:** We build your enclave to fit your environment—unlike many MSPs that require you to adapt to their pre-configured platforms—reducing the burden on your internal teams.
- **Full Ownership:** With Coalfire's CMMC Enclave Build, the certification is truly yours. You maintain complete ownership of the infrastructure, security tools, and licenses.
